

Sheep & Goats FAQ

Version 1.0: March 2022

What is PCC's standard for lamb and goat meat?

PCC requires that all fresh meat be certified organic or non-GMO verified. The standard also includes specific criteria to ensure the sheep and goats raised for fresh meat sold at our stores are treated humanely, have access to the outdoors, and are not given hormones or antibiotics. You can read our full sheep and goat standard [here](#).

Which certifications help ensure better animal welfare?

PCC supports third-party certifications that have rigorous and transparent standards, routine auditing, and accountability for suppliers who fail to meet their requirements. PCC is a strong advocate for USDA organic certification, because it is the only seal that is backed by a federal law and sets strong production standards. However, while organic provides [some assurances concerning animal welfare](#), such as requiring at least 120 days of free access to certified organic pasture per year for ruminants, it does have some gaps, both within the standard and through enforcement. Coupling organic certification with additional animal welfare certifications, such as [Animal Welfare Approved](#) from A Greener World or [Certified Humane](#), provides the best assurance of animal and environmental protections.

PCC also supports regenerative farming certifications that require organic as a baseline and then set stricter requirements around treatment of animals, such as [Regenerative Organic Certification](#) from the Rodale Institute and the [Real Organic Project](#) certification. The certifications noted here are just a few examples of the many that have been developed and there are resources available online to help consumers sort through all the labels and claims that can be found on meat and animal products. The American Society for the Prevention of Cruelty to Animals (ASPCA) has developed a [meat, eggs, and dairy label guide](#) that provides information on common claims and ASPCA-recommended certifications and the Animal Welfare Institute has a [consumer guide that ranks labels and welfare claims](#) from best to worst. Additionally, Consumer Reports has a [Food Label Guide](#) that rates various labels and claims to help consumers identify which ones have little meaning behind them versus those with true guarantees.

Does the USDA organic certification guarantee better animal welfare?

While the organic label does [provide some improvements](#) around the treatment of animals compared to industrial, conventional production, it is not as protective of animal welfare as most consumers would like it to be. It requires outdoor access for animals, at least 120 days of pasture grazing for ruminants, and prohibits using certain substances like antibiotics and growth hormones that are associated with lower animal welfare. Some of the regulations, however, have been interpreted differently, such as the stipulation for “outdoor access,” resulting in some large producers doing the bare minimum to obtain organic certification. PCC and many others in the organic community have been pushing for better livestock protections and [advocating for the USDA](#) to implement a set of rules that would strength the animal welfare requirements under the organic label.

Why does PCC require organic certification or non-GMO verification for fresh meat products?

PCC prioritizes organic certification for our fresh meat because organic production standards are better for the animal, consumer, and the planet. For example, ruminant livestock are required to be on pasture for at least 120 days of the grazing season. Additionally, organic prohibits the use of hormones and antibiotics, which studies have shown can remain in the meat after slaughter, posing a health risk to consumers.^{i,ii} Organic certification also prohibits the use of GMO feed.

If a producer is not certified organic, PCC requires them to obtain non-GMO verification, which means the animals are not given GMO feed. Producers must also, of course, still meet PCC's standards for no antibiotics or hormones, access to outdoors, and more. We know that avoiding GMOs is a top priority for PCC shoppers, so requiring the certification provides an additional layer of protection to ensure our producers are meeting that requirement. While non-GMO feed doesn't significantly impact animal welfare or determine a producer's other practices, PCC believes it is important because a large percentage of [GMO cropland is produced to feed animals](#). Requiring non-GMO certification for the non-organic fresh meat sold at PCC is another way we can avoid participating in the GMO supply chain.

Why is organic and pastured-raised meat more expensive than conventional?

Meat from animals raised in more sustainable and ethical environments, like those sold at PCC, more accurately reflects the costs of production. Conventional industrial livestock operations can produce less expensive cuts of meat by prioritizing quantity over quality of life and externalizing their costs—the cost of the product at the store might be lower, but the [long term costs](#) are significantly greater in terms of human health, animal welfare, public health (such as from waste fields that pollute the air and water and overuse of antibiotics that contributes to the development of antibiotic resistance), and greenhouse gas emissions. There are also higher costs associated with third-party certifications, like USDA organic, which are reflected in the cost at the shelf.

How do you ensure products sold meet your animal welfare standards?

PCC has a number of ways in which we ensure our suppliers meet our standards. First, we seek out potential vendors that align with our mission, vision, and values, including other cooperatives and producers that often establish and audit against their own set of strong animal welfare standards. Next, we request that they provide us information about their production practices by filling out a vendor checklist, which asks about outdoor access, stocking density, feed, antibiotic use, and more. For local vendors, in Washington state or Oregon, we try to arrange visits to tour farms and ranches whenever possible and permissible under public health circumstances. Lastly, we prioritize strong third-party certifications, such as organic, to ensure product claims and integrity.

Does PCC purchase lamb from Australia or New Zealand?

Australia and New Zealand are both well known for having large lamb industries and a significant portion of the lamb sold in the United States is imported from those countries.ⁱⁱⁱ While the lamb market in the US is much smaller, PCC purchases lamb from only domestic, local ranches that meet our animal welfare standards. Since the 1990s, PCC has sourced the majority of our lamb from [Umpqua Valley Lamb](#), located in western Oregon. Their lambs graze year-round on fresh pastures that are a mix of grass, sweet clover, and alfalfa.
